1 / 1 punto

1	The	fun	ction

 $\beta(\mathbf{x}, \mathbf{y}) = \mathbf{x}^T \begin{bmatrix} 2 & -1 \\ -1 & 1 \end{bmatrix} \mathbf{y}$

is

- not an inner product
- not bilinear
- positive definite

Yes, the matrix has only positive eigenvalues and $\beta(\mathbf{x}, \mathbf{x}) > 0$ for all $\mathbf{x} = \mathbf{0}$ and $\beta(\mathbf{x}, \mathbf{x}) = 0 \iff \mathbf{x} = \mathbf{0}$

✓ bilinear

Yes:

- eta is symmetric. Therefore, we only need to show linearity in one
- For any $\lambda \in R$ it holds that $\beta(\mathbf{x} + \lambda \mathbf{z}, \mathbf{y}) = \beta(\mathbf{x}, \mathbf{y}) + \lambda \beta(\mathbf{z}, \mathbf{y})$. This holds because of the rules for vector-matrix multiplication and addition.
- symmetric
 - \bigcirc Correcto Yes: $\beta(\mathbf{x}, \mathbf{y}) = \beta(\mathbf{y}, \mathbf{x})$
- an inner product
- ✓ Correcto

It's symmetric, bilinear and positive definite. Therefore, it is a valid inner product.

- not symmetric
- not positive definite
- 2. The function

 $\beta(\mathbf{x}, \mathbf{y}) = \mathbf{x}^T \begin{bmatrix} 1 & -1 \\ -1 & 1 \end{bmatrix} \mathbf{y}$

is

✓ bilinear

Correct:

1/1 punto

1/1 punto

- β is symmetric. Therefore, we only need to show linearity in one argument.
- $\beta(\mathbf{x} + \lambda \mathbf{z}, \mathbf{y}) = \beta(\mathbf{x}, \mathbf{y}) + \lambda \beta(\mathbf{z}, \mathbf{y})$. This holds because of the rules for vector-matrix multiplication and addition.
- not bilinear
- symmetric
 - Correcto

Correct: $\beta(\mathbf{x}, \mathbf{y}) = \beta(\mathbf{y}, \mathbf{x})$

not positive definite

✓ Correcto

With $x = [1, 1]^T$ we get $\beta(\mathbf{x}, \mathbf{x}) = 0$. Therefore β is not positive definite

- positive definite
- not symmetric
- not an inner product
- **⊘** Correcto

Correct: Since β is not positive definite, it cannot be an inner product.

- an inner product
- 3. The function

 $\beta(\mathbf{x}, \mathbf{y}) = \mathbf{x}^T \begin{bmatrix} 2 & 1 \\ -1 & 1 \end{bmatrix} \mathbf{y}$

is

- symmetric
- not symmetric
- ✓ Correcto

Correct: If we take $\mathbf{x} = [1, 1]^T$ and $\mathbf{y} = [2, -1]^T$ then $\beta(\mathbf{x}, \mathbf{y}) = 0$ but $\beta(\mathbf{y}, \mathbf{x}) = 6$. Therefore, β is not symmetric.

✓ bilinear

Correct.

- not bilinear
- an inner product
- not an inner product

$\overline{}$		
$\langle \rangle$	Cor	rocto

Correct: Symmetry is violated.

4. The function

1/1 punto

$$\beta(\mathbf{x}, \mathbf{y}) = \mathbf{x}^T \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \mathbf{y}$$

is

not symmetric

positive definite

It is the dot product, which we know already. Therefore, it is positive definite.

an inner product

✓ Correcto

It is the dot product, which we know already. Therefore, it is also an inner product.

not positive definite

✓ bilinear

✓ Correcto

It is the dot product, which we know already. Therefore, it is positive bilinear.

symmetric

It is the dot product, which we know already. Therefore, it is symmetric.

not bilinear

not an inner product

5. For any two vectors \mathbf{x} , $\mathbf{y} \in R^2$ write a short piece of code that defines a valid inner product.

1 / 1 punto

```
import numpy as np

def dot(a, b):
    """Compute dot product between a and b.

Args:
    a, b: (2,) ndarray as R^2 vectors

Returns:
    a number which is the dot product between a, b

"""
```
